

Technology Stack

Date	27/06/2026
Team ID	xxxx
Project Name	Personalized Networking Assistant
Maximum Marks	2 Marks

Define Your Technology Stack

The table below details the specific technologies chosen for each component of the Personalized Networking Assistant, along with the justification for each choice.

S.No	Architecture Component / Layer	Technology Chosen	Justification / Purpose
1	Frontend / Client-Side	Streamlit	Fast to build an interactive Python-native UI with minimal boilerplate; easy to add a premium glassmorphism/gradient design for the demo.
2	Backend / Server-Side	Python, FastAPI (Uvicorn)	Lightweight, async-ready REST framework with automatic docs; fast to wire up the 5 endpoints needed (analyze, generate, fact-check, history, feedback).
3	Database / Data Storage	Local JSON files (history.json, feedback.json)	Project scope doesn't need a relational/NoSQL server; JSON keeps setup simple for local single-user use and easy to inspect/debug.
4	Cloud / Hosting / Deployment	Runs locally (no cloud hosting for this submission)	Scope of the internship deliverable is a local runnable app; architecture is deploy-ready (Streamlit Cloud / any Python host) if hosted later.
5	Version Control & CI/CD	Git & GitHub	Standard version control for tracking changes and submitting the repository; enables collaboration and rollback if needed.
6	Third-Party APIs / Other Tools	Google Gemini API (google-genai, gemini-2.0-flash), Wikipedia API, pytest	Gemini powers theme extraction and conversation-starter generation; Wikipedia API verifies factual claims; pytest provides automated testing (15 passing tests).
