Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report

This report outlines the Personalized Networking Assistant, an AI-powered tool that generates relevant, fact-checked conversation starters to help users network more confidently at professional events.

Project Overview	
Objective	To help professionals build confident, meaningful connections at networking events by instantly generating relevant, fact-checked conversation starters.
Scope	The project covers AI-based theme extraction from event/industry context, conversation-starter generation, Wikipedia-based fact-checking, and history tracking, delivered via a Streamlit UI backed by a FastAPI service.
Problem Statement	
Description	Professionals often struggle to start and sustain conversations at networking events due to a lack of quick, relevant, and reliable talking points.
Impact	This leads to missed opportunities, increased social anxiety, and less effective networking outcomes for attendees.
Proposed Solution	
Approach	Use the Google Gemini API to analyze event/industry context and generate personalized, 2-3 sentence conversation starters with a hook and follow-up angle, then verify key facts using the Wikipedia API.
Key Features	• AI-generated, context-aware conversation starters • Built-in Wikipedia fact-checking of talking points • History tracking of past generated starters • Fallback starter templates when the API quota is exhausted

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	CPU specifications, no GPU required	Standard laptop CPU
Memory	RAM specifications	8 GB

Storage	Disk space for code, data, and logs	~500 MB
Software		
Frameworks	Python frameworks	Streamlit, FastAPI
Libraries	Additional libraries	google-genai, requests, wikipedia, pytest, python-dotenv
Development Environment	IDE	VS Code
Data		
Data	Source, size, format	No static dataset; content generated live via Gemini API, stored locally as JSON
