Customer Journey Map

The map below captures the experience of a user of the Personalized Networking Assistant, stage-by-stage, before, during, and after a networking event.

Phase of Journey	Stage 1: Pre-Event Preparation	Stage 2: At the Event	Stage 3: Post-Event Follow-up
Actions (What does the customer do?)	- Opens the app before attending a networking event - Enters event name / industry to generate starters - Reviews the fact-checked talking points	- Refers to saved starters while approaching people - Uses suggested hooks to open conversations - Mentally notes new contacts made	- Opens the History tab to revisit generated starters - Reflects on which topics worked well - Provides feedback on the generated content
Touchpoint (What part of the service do they interact with?)	- Streamlit “Generate Starters” page - Gemini-powered topic generator - Wikipedia fact-checker module	- App screen on laptop/mobile - Saved starter list - In-person conversation	- History page (data/history.json) - Feedback module (data/feedback.json) - App dashboard
Customer Thought (What is the customer thinking?)	“Will these starters actually be relevant?” “I hope this saves me prep time.” “I want accurate facts, not made-up info.”	“This opening line worked well.” “Glad I have a backup topic ready.” “This makes me look informed.”	“I should reuse this approach next time.” “It would help to know which starters worked.” “I want quick access to past events.”
Customer Feeling (What is the customer feeling?)	- Slightly anxious, but hopeful - Curious - Reassured by the fact-check	- Confident - Engaged - Less anxious than before	- Satisfied - Reflective - Motivated to use the app again
Process Ownership (Who is in the lead on this?)	Frontend team (Streamlit UI) & Backend team (topic_generator.py)	End user (self-service, no manual intervention needed)	Backend team (history.json, feedback module)

Opportunities (How can we improve this stage?)	• Add quick-start templates for common event types • Reduce starter-generation load time • Improve fallback starters when API quota is exhausted	• Add offline/cached mode for low connectivity • Allow starring favorite starters • Add voice-based access	• Add analytics on most-used starters • Allow tagging/sorting history by event • Add export to PDF/notes
